

An explanation of why water will change colour when using the Q ENERGYspa® and what this means.

It is very difficult to discern anything from the water colour changes and sediments that precipitate out during a session with the Q ENERGYspa®. It is a very complex interaction of the bio energetic field of the person (their Aura), the water, and the activated Orb of the Q ENERGYspa®.

If water conditions are "destabilizing" to the positive rings, a number of reactions occur that result in the positive elements contributing to sediment and colour. Add to this the myriad of dissolved solids and chemicals already present in the water reacting with the field produced the temperature of the water and you can have considerable precipitation of varied sediments of many different colours and textures.

When combined with the Bio energetic field of the person having the session this complexity increases enormously. In many instances where the water turns colour, it will do so without the presence of anyone in the water, however, the interesting thing is that when all these interactions occur, the influence of the individual can be very interesting.

It really is not possible to discern meaning in the water post session other than at an energetic level. Our experience has been that as a persons' energy field becomes more balanced or coherent (i.e. as their body comes back into balance), their energy field contributes less to the destabilisation of the positive rings, and therefore, there is generally less discolouration of the water. In fact, we've seen that a coherent energy field (someone who is in balance) can have a stabilizing affect on the process, so much so that the water colour/sediments/textures for these individuals is lighter/different and in some cases non existent than the baseline water without anyone in it.

Water temperature 33° Celsius

After 35 minutes

Experiment carried out using earlier model 3024 power supply and an Array.

Water temperature 61° Celsius

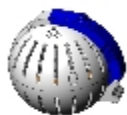

After 35 minutes

There are interesting energetic exchanges that can be observed with different individuals having a session but at this time we have not found any reliable method that can evaluate what these sediments may indicate or represent due to the incredibly large number of variables present for each individual session.

Even people with similar conditions can present vastly differing water samples post session due to each person's unique energy signature and other contributing factors at the time of the session.

It is a misguided (or there may be another word for it) person who would try to correlate specific colours and conditions of the water with "things" released from the body or a particular condition suffered. It is our opinion there are so many variables it is virtually impossible to do this with any real degree of accuracy. Especially, if a baseline sample i.e. water "charged" by the Q ENERGYspa® without anyone in contact with that water is not taken for the specific day that the sessions occur. Water is a living thing and is affected by many external factors even changes in water temperature have shown to influence significant differences in water colour and amounts of sedimentation on the same day using the same container and the same water source with no one present.

Adding salt as a conductive agent (which is always insisted upon by other technologies no matter how conductive the water already is) will without fail produce significant sediments etc on its own. Even using different types of salt will give variances in sediments and colours. The Q ENERGYspa® is designed to work in ordinary tap water without the addition of any conductive agents but there are circumstances where this is necessary. We only recommend adding enough conductive agent to allow the product to work at the optimum level on the lowest power setting. This is to minimize wear on the Orb and connecting cable and to minimize the amount of sediments and colours that may occur during a session. An average would be ¼ to ½ of a teaspoon of salt to 3 gallons of water.

Footbaths conducted using model 3024 power supplies and model 2000 Arrays.

A photo of different water samples from 13 different people using the same water on the same day. Guess which one is a smoker.

Hint: The one you would least expect if the colour of the water was supposed to indicate anything.

Another aspect that will make a significant difference to water colours and sediments is the type of electronics used and configuration of electrodes both in the shape and type of metals used.

Focussing on the electronics first one can use either a transformer based power supply the same as the Q ENERGYspa® or a switch mode power supply (as used by most attempts at alleged similar technologies). The reason a transformer based power supply is used is to provide the smoothest power flow to the Q ENERGYspa® possible to minimize interference with the signature produced in the water. Earlier power supplies produced by Q Tech Laboratories Pty Ltd used an off the shelf transformer that did the job required but still introduced "noise" into the circuit which contributed not only to colours and sediments but also gave the user a sensation of something happening due to the fact the power flow was not quite in resonance with the user.

Over the ten years Q Tech Labs has been manufacturing the Q ENERGYspa® many advances in electronics have occurred and in recent years we have had a transformer manufactured to specific standards outlined by us to significantly reduce this interference. There have also been a number of changes to the internal circuitry of the power supply to smooth out the power flow to make it more coherent with the human bio energy field. The original Array housed the exact same configuration of metal rings as the current Orb but due to manufacturing process the alignment of the rings in the earlier Array could be out by a few degrees. This misalignment while not detrimental would also create a significant enough distortion that many users experienced what they thought was a powerful change occurring within their body. While in fact it was their body indicating that it wasn't quite true with their energy field.

With the introduction of the Orb this misalignment of the rings was virtually eliminated. When we take into account the differences with the power supplies and the improved alignment of the rings this too decreased the amounts of sediments and colours in the water post session over earlier models of the Q ENERGYspa® as the smoothed power flow created less distortion resulting in less drama in the water. By using different types of metals and differing shapes of these metals it is quite easy to produce significant colours and sediments while claiming all manner of alleged benefits based on these colours and sediments and the feeling one gets while exposed to the field generated by these divergent technologies. But if we remain true to the science behind the Q ENERGYspa® these divergences away from the Orb configuration used by Q Tech Laboratories may have long term ramifications that will only come to light after a number of years continued use. Think of it as being similar to living under high tension power lines, our bodies are very adaptable and as such we may not notice anything at all or it may take some time for the true affects to surface but after prolonged exposure most find they have some form of detrimental affect from being exposed to these energy fields. The Q ENERGYspa® has been in use by hundreds of thousands of people for over ten years with not one reported side affect.

The final aspect to water colour and sediments can be the user themselves. Each and every person is totally unique they have a differing energy field from the next. Just as no two people have the same finger print, no two people have the same energy field even if they were identical twins with exactly the same diagnosed health condition each would have a very different energy field. Each would have their own different interaction with the Q ENERGYspa® in the water on the same day that would have a bearing on what may or may not precipitate out of the water and each could quite easily receive a different result from a session because each persons body would have different aspects of their health that it would want to deal with at that time. This is why some people notice a change within a few sessions while with others seemingly with exactly the same condition can take months of regular sessions before achieving the same result. The Q ENERGYspa® does not induce this change in the condition, it is each persons' own "innate intelligence" the doctor within that determines what it will do with the energy the Q ENERGYspa® provides.

Our position is that as your body assimilates the compatible bio energy from the water in the container, your body's innate intelligence will direct the application of this energy. If detoxification is the application required then the expected means would be through the body's normal channels of elimination i.e. bowel and urine.

It was read somewhere recently where it was said for a person to Detox through their feet the amount of toxins excreted in urinating once it would take no less than ten days. Your body knows what the primary area of concern is, it also knows what it has to do to achieve a turnaround in that condition and it will do this in the safest and quickest way possible with the least amount of disruption to your everyday life.

Water temperature 31° Celsius

After 35 minutes

As an indication of how the technology has changed and improved this is a temperature experiment that was conducted in July 2005 using the latest model 4105 system with the latest Orb. The water is the same tap water as the earlier experiment was done in. The temperature is within 2° degrees celsius of the original experiment. Check the front page again.

Same unit same water source same day different temperature. 47°
